

Faith Ku

I am interested in the microscopic and concealed elements of botanical, fungal, and animal life and the seamless connection and integration within and between kingdoms. Using the architecture of mycelium, I create a framework by which these elements connect to the system. Both fragile and resilient, life thrives and finds a rhythm, a cycle. Mortality is not the end, as matter is repurposed, continuously transforming reality for the living. The past becomes the future, as the elements in our bodies were once in the stars and, before that, part of the Big Bang. We are all connected, transforming, and moving forward to wherever that may be.
